

SERVICE BULLETIN

Title: Log4j Vulnerability
Timeline: Immediate
Subject: CFS Systems Safe from Log4j Vulnerability

As you may be aware, there has been a recently discovered bug in the Java library Log4j which essentially allows attackers remote control over targeted servers. CFS customers should not be affected by this threat as the affected log4j version (log4j-2) is used in OpenEdge 11.7.11 and newer, which are **not** versions currently utilized by CFS. No matter what version of CFS system you have implemented, your system does not use the log4j version affected by this vulnerability.

We understand the gravity and importance of cyber security to our customers and we assure you that CFS teams are doing their due diligence and continuing to investigate this matter.
